Abstract: Whenever a decreased internal standard of our society is realized fully by sensitive political system they came out with rigorous of external force or legal sticks to control this socially unaccepted behavior of our society. It may be child abuse, domestic violence, gender and caste discrimination, communal violence, crime against women, people with disabilities etc. In the similar fashion cybercrime is another internationally recognized problem our society is facing. To effectively deal with all the aforesaid problems, we need to understand its psychosocial implication and suggest intervention.

What has happened in the recent past, cannot be ignored that the anarchy caused by the extensive incidents of data breaches. Sensitive data and personally recognizable information of millions of individuals were exposed and made available on various platforms of the dark web for malevolent users to buy and use. As all of us know that the data breaches are easily the single most worrisome trend in the world of cybercrime, and it does not look to be slowing down the year 2019. This paper is an attempt to understand how low internal standards on the part on individuals is responsible for cybercrime and how external forces can control such deviant behavior.

Keywords: Cybercrime, Psychosocial Implication, Data Breaches.
